

CO2 Head Spa

Carbon Dioxide Head Spa

Carbonated bubbles stimulate the scalp to give an effect similar to receiving a soft massage, and this skin stimulation also increases scalp elasticity. In addition, carbonated bubbles that move minutely on the scalp effectively detoxifies the scalp and has the effect of calming scalp dryness and swelling.

The 13 Steps of the CO2 Head Spa

- 1) Scalp Analysis - We use highly magnified lenses that allow us to see closely into the scalp's pores and hair follicles. This lens can be attached on a cellular phone camera to enhance the photo itself, and allows easy photo reception for clients.
- 2) Oil Scent Choice - An essential oil of choice is applied onto the scalp, allowing natural or chemical oils and buildup to break down. Since it is a liquid, it is able to seep into the pores.
- 3) Steaming - The head is then covered with a sealed cap that allows filtered steam to open the scalp pores and help oils seep into them. This lets the scalp breathe in the essential oils.
- 4) Air Scalp Tonic - The bubbly tonic massages your now open pores and detoxifies any of the now lifted debris. Definitely a highlight of the spa as it cools down the scalp after the steam.
- 5) Shampoo - A team member will then lead you to one of our spa chairs that fully recline back for a comfortable scalp and hair wash. We exclusively use shampoos that are dedicated to the scalp cleansing process, and are not open to the public for sale with the exception of our salon.
- 6) Galvanic Massage - The galvanic high frequency device is then used to massage roots of the hair follicles, cleaning the skin around the pores. The galvanic device sends high frequency microcurrents through the scalp and roots to improve scalp elasticity and clean the skin texture.
- 7) Rinse and Massage - A team member will fully rinse out the remaining shampoo and give you a short neck and head massage to calm you down before putting a hot towel under the neck and over the eyes for a warm immersive sensation.
- 8) Carboxy Spa Tablets - Carboxy spa tablets are then added into a pool of water which then threads down the scalp using our spa waterfall. Clients are then left for a few minutes to relax, fall asleep, and enjoy this spa experience.
- 9) Hair treatment - Once the timer is done, a team member will rinse out the residue, and apply a hair treatment to the ends of the hair for added hydration and to treat the ends.
- 10) Post-Spa Analysis - A photo of your scalp will be taken after the spa to show the difference. You will find that your pores have been opened, build up and flakes have been removed and the follicles have been cleared of any residue.
- 11) Scalp Toner - Much like a skin toner, a scalp toner is applied to the scalp base while wet. It settles down the scalp and calms down any redness and sensitivity.

- 12) Heat Protectant & Blowdry - A heat protectant spray is applied to the hair to protect against any heat damage. We recommend clients to dry their roots after every wash to ensure that your scalp stays clean!
- 13) Styling - One of our team members will come to style your hair with a hair straightener. All of our team members are trained to curl and straighten hair with a straight iron.
